Tamarisk has invaded riparian areas across Colorado with major river drainages affected in the western, southeastern and northern portions of the state. NRCS and partners have been actively involved in Tamarisk removal and restoration projects throughout the state. This poster details NRCS and partner activities throughout the distribution of Tamarisk in Colorado. Resources, techniques and partnerships are detailed that include acres affected and areas planned for future treatment and restoration. Mapping efforts and the development of suitable replacement materials will also be highlighted.
